

Illustrations of end ridges and hips

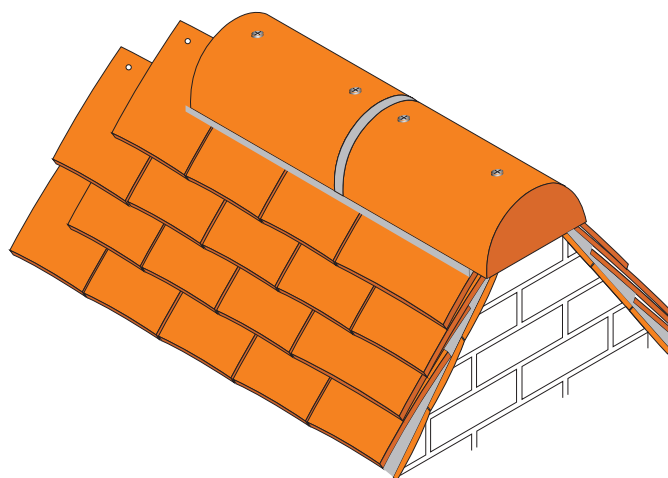

Sandtoft produces a range of end ridges to suit its ridge and hip tiles. These are available in clay, Duracoat and concrete.

The following illustrations show examples of end ridges.

Block end: These are used at gables, usually with cloaked verge tiles or dry verge systems such as Multiverge or 20/20 verge.

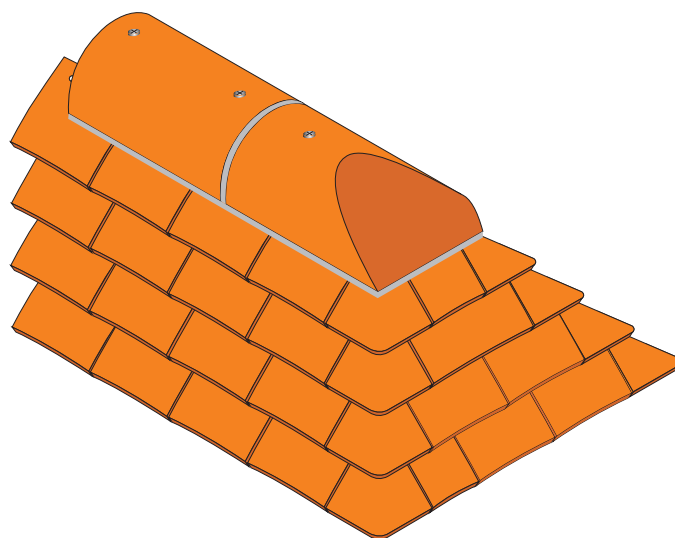

Gable stop end: These are used at gables, usually with bedded verge tiles.

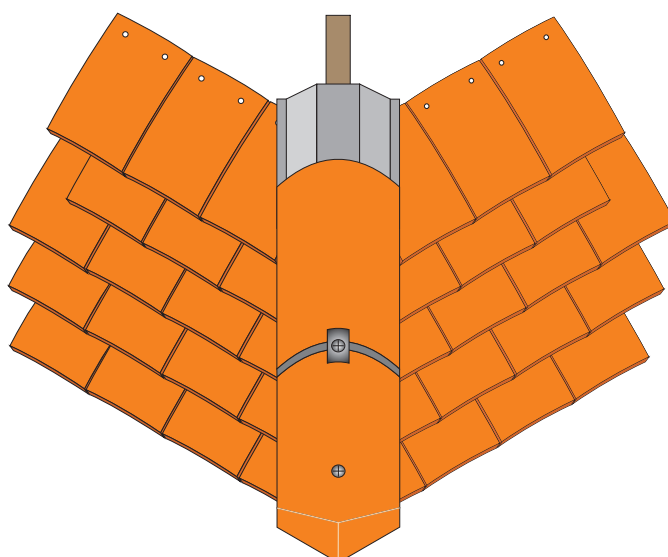

Hip end: These are used on the ridge, where the ridge meets 2 hips. Suitable for use with plain tiles with bonnet, arris or mitred hips. Also suitable for use with BritLock slates and BritSlates with mitred hips.

Hip starter ridge: These are used on the hip at the eaves. Normally used with Roll Hip but could also be used with bedded hips.
